

Name: _____

Match the part of the flower to its function

Structure		Function
Stigma		They protect the unopened flower, especially in the bud stage.
Style		They may be brightly coloured to attract insects
Ovary		The thin stick-like structure that holds up the anther
Pollen Grains		They produce male cells called pollen grains
Ovules		The male cells of the flower
Filament		The sticky, top of the female part of the flower which collects pollen grains
Anther		The thin tube that connects the stigma to the ovary. It contains the pollen tube.
Pedicel		It contains the ovules. It turns into the fruit when the flower is fertilized.
Sepals		They contain the female cells.
Petal		It is the stem that connects the flower to the plant
