SUNFLOWERS. Fascinating Facts

A sunflower only requires 90 to 100 days to grow.

The sunflower plant can grow from 3 to 18 feet tall.

A single Sunflower can have up to 2,000 seeds.

The sunflower seed head forms a spiral.

The sunflower actually tracks sun's position sky. This is called heliotropism.

HELP THE ENVIRONMENT

An emerging technology called rhizofiltration, hydroponically grown sunflowers are grown floating over water. Their extensive root systems reach deep into sources of polluted water and extract large amounts of toxic metals, including uranium. The roots were able to extract 95% of the radioactivity in the water left behind by the accident at Chernobyl.

LAM MANY

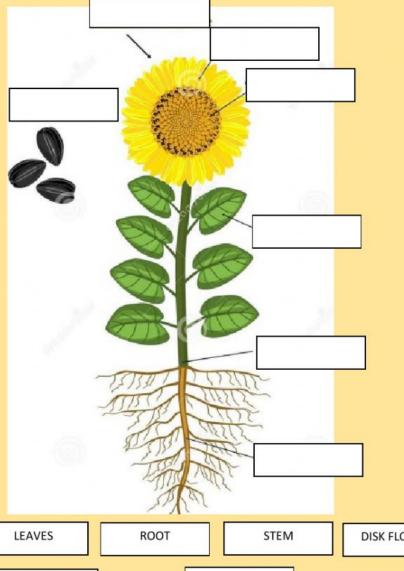

When you look at the yellow petals you're actually seeing the protective leaves that cover the center of the head while it is growing. The brown Centrex of the sunflower is made up of hundreds of individually growing flowers, where a sunflower seed will emerge.

The tallest sunflower was grown in the Netherlands by M. Heljmf in 1986 and was 25' 5.5" tall.

A) Look and write TRUE/FALSE

- 1) Sunflower plants grow within 90-100 days_____
- 2) A sunflower can be very tall____
- 3) A single flower hasn't got a great number of seeds_____
- 4) The sunflower doesn't follow the sun position_____
- 5) The yellow petals of the sunflower head form the inflorescence____
- 6) The brown centre is formed by hundreds of flowers___
- 7) After Chernobyl, radioactivity was absorbed by roots of sunflowers grown into water
- 8) The smallest sunflower was grown in the Netherlands____

B) Locate the sunflower parts in the correct place
