

ACCURACY & PRECISION

Definitions:

Accuracy - how close a measurement is to

Precision - how close a measurement is to

Precision versus Accuracy:

Look at each target and decide whether the "hits" are accurate, precise, both accurate and precise, or neither accurate nor precise: (Note: An accurate "hit" is a bulls eye!)

Precision Problems:

A group of students worked in separate teams to measure the length of an object. Here are their data:

Team 1	Team 2	Team 3	Team 4	Team 5	Team 6	Team 7
2.65 cm	2.75 cm	2.80 cm	2.77 cm	2.60 cm	2.65 cm	2.68 cm

- The average length is cm.
This is the mean or average.
- Subtract the highest value from the lowest value: cm.
This is the range or spread.
- Divide this number by 2: cm.
This is the approximate $\pm$ range from the average.
- The precision of the measurement can be shown as average $\pm$ range.
The precision of the measurement was $\pm$ cm.

ACCURACY & PRECISION

A second group of students obtained the following data:

Team 8	Team 9	Team 10	Team 11	Team 12	Team 13	Team 14
2.60 cm	2.70 cm	2.80 cm	2.75 cm	2.65 cm	2.62 cm	2.78 cm

- The average length is cm.
This is the mean or average.
- Subtract the highest value from the lowest value: cm.
This is the range or spread.
- Divide this number by 2: cm.
This is the approximate $\pm$ range from the average.
- The precision of the measurement can be shown as average $\pm$ range.
The precision of the measurement was $\pm$ cm.

In comparing groups, the first or the second, which group was more precise or was the precision the same? **Justify your answer.**
