

Count and write the number of terms in these expressions. Then, categorise the given expressions as monomial, binomial, trinomial or polynomial.

For example:  $x - 5$

No. of terms= 2

Types of expression = Binomial

| Expressions       | No. of terms | Types of expressions |
|-------------------|--------------|----------------------|
| $7xy + 9yz$       |              |                      |
| $a + b - 7$       |              |                      |
| $m - 2$           |              |                      |
| $7y + z - 6$      |              |                      |
| $P + 5q - 7z + 4$ |              |                      |
| $8a - 5b + 6$     |              |                      |
| $17b$             |              |                      |
| $-3x + 2y$        |              |                      |
| $xy$              |              |                      |
| $42y + 3x$        |              |                      |

|                  |  |  |
|------------------|--|--|
| $9 + 4p + z - 2$ |  |  |
| 6t               |  |  |
