that
Meat-eating plants like the Venus flytrap are special plants.
grow in places don't have the things most plants need for
survival. For example, the soil where these plants grow may not
have the nutrients needed. Such plants have found new ways to
live and grow.

Like the Venus flytrap, the pitcher plant is a plant eats
insects. Insects are attracted to the top of the plant, the
part has the brightest colors. Then the insect is trapped
by tiny hairs grow inside of the plant.
