

Compare and contrast in science

Compare and contrast the outer and inner planets of our solar system using the table and columns below.

Iron and rock make up most of the four smaller inner planets of our solar system. Gas and water make up most of the four larger outer planets. This means that you can stand on the surface of Earth, but you can't stand on Saturn. In fact, if you tried to stand on Saturn, you would sink down to the **core** of the planet.

Inner Planets (Different)	Same	Outer Planets (Different)
