Main Idea and Key Details

Spiders

Read the paragraph below and complete the main idea chart below.

Spiders eat in an unusual way. They don't chew and swallow food like you do. They drink it.

First the spider stabs its prey with its fangs and injects poisonous venom to stop it from moving.

Then it dribbles digestive juices on its meal. This turns the animal's insides into soup, so the spider can slurp them out. Afterward, all that's left of the prey are empty bits of skin and some wings.
