Science

Plant and Animal Cells

Cells are very tiny. A cell is like a tiny bag that is filled with a special liquid. This liquid helps other parts of the cell move around. The nucleus is the brain of the cell. It tells all the other parts what to do.

When cells grow together, they make plants and animals. Plant cells also have special parts that change sunlight into food.

INSTRUCTIONS: Print page 30 diagram of a cell and attach to your science notebook.
