

Are Siblings More Important Than Parents?, The Atlantic Review

How brothers and sisters shape who we are Ben Healy
November 2018 Issue

We don't choose our siblings the way we choose our partners and friends. Of course, we don't choose our parents either, but they usually make that up to us by sustaining us on the way to adulthood. Brothers and sisters are just sort of *there*.¹ _____ This holds whether they are older and cool, or younger and frustrating; whether we follow in their footsteps, or run screaming in the other direction.

Part of siblings' sway has to do with their sheer *presence*. Eighty-two percent of kids live with a sibling (a greater share than live with a father), and about 75 percent of 70-year-olds have a living sibling. For those of us who have brothers or sisters, our relationships with them will likely be the longest of our life.

Whether these relationships make our life better or worse is a more complicated question.
2. _____. This effect can be complicated by a full house, however. Kids with more siblings (a larger "sibship," to use the industry term) do worse in school —although the universality of this finding has been challenged by studies of Mormons and the entire population of Norway.

3. _____. Tense sibling relationships make people more likely to use substances and to be depressed and anxious in adolescence. Moreover, sibling bullying makes a kid more likely to engage in self-harm as a teen and to become psychotic by age 18.

Whether a person models herself after her siblings or tries to distinguish herself has particularly _____ important _____ consequences.
4 _____, while those who spent unequal time with their dad and perceived unequal parental treatment had diverging educational fortunes. Not that divergence is necessarily bad: Research suggests that as siblings' relationships with their parents grow more different over time, their relationship with each other may become warmer. And emulating your sibling can be a mistake, depending on what she's up to:⁵ _____. Younger siblings

also may have sex earlier than older ones (partly because their big brothers and sisters introduce them to more experienced potential partners).

One way or another, sibling influence is lasting. A study of more than 1 million Swedes found that one's risk of dying of a heart attack spikes after a sibling dies of one, due not only to shared DNA but also to the stress of losing such a key figure. Which makes sense:6_____. Siblings seem like they're just *there* only until they aren't.
