## THE DIGESTIVE SYSTEM

The digestive system gets the **nutrients** we need from food. This system is made up of the **mouth**, **esophagus**, **stomach**, **small intestine** and **large intestine**.

- Mouth: teeth break the food into small pieces.
- Esophagus: it's a long tube. Food goes down here to the stomach.
- **Stomach:** in the stomach, gastric juices break down the food and turn it into a thick liquid.
- Small intestine: nutrients pass into the blood here.
- Large intestine: the food our body doesn't need goes along here and out through the anus.
