

## Fish

Fish live in water. They are covered with **scales** and have fins. **Fins** help them move through the water. Fish breathe through their **gills** and lay **eggs**. Fish are **cold-blooded** animals. This means that their body temperature changes as their environment changes.

The **Nassau Grouper** is one of the largest fish on the reef. It has (5) five dark bars on the body and, a dark band running from snout, through the eye to the forehead side of dorsal fin and a dark spot on the base of the tail fin. It changes colour depending on the environment it is in. This helps to hide it so it can ambush fish to eat. Humans are the predators that have the biggest impact on the grouper populations.
