INVASIVE SPECIES

Invasive species are organisms that are not native to an area. They are usually from a different place. Sometimes they get there by accident. Other times, people bring them in.
Invasive species can sometimes take over an area. They adapt to their new homes. They usually don't have predators in their new home so they can grow quickly. They grow so quickly that the native species can't keep up.

Match the Words to their meanings

Plants and animals that are naturally from an area	Prey
	Native species
Plants and animals from a different habitat that start to take over a new area	Predator
An organism that eats another	Invasive Species
