# Stages in a Human Life Cycle

All human beings experience a series of growth stages during their life time (birth to old age). These stages are prenatal, infancy, childhood, adolescence and adulthood.

# Prenatal (nine months before birth to birth)

At this stage the child is still in the mother's womb. This is also a period in which rapid growth is taking place. All body parts develop. These include tissues, organs and systems needed for life support.

# Infancy (birth until two years)

In this stage the body becomes bigger and stronger as the child changes from an infant to a toddler.

#### Childhood (three years to ten years)

During this stage several things occurs.

- · Mastery of skills and independence.
- · Learning and getting ready for school.
- · Development of a wide range of skills and abilities.
- · Puberty, or sexual development begins during later years of this stage.

## Adolescence (ten to eighteen plus years)

This is a stage of rapid mental, emotional and physical growth and development.

## Adulthood (nineteen years until death)

Adulthood is that period of greatest strength and stamina. During this stage physical growth ceases, but growth continue mentally, emotionally and socially. However physical abilities decline with age.

<ol> <li>Which of the following happens during the adult stage?         <ul> <li>(a) Puberty begins</li> <li>(b) The body becomes bigger and stronger</li> <li>(c) Physical growth ceases</li> <li>(d) All of the body parts develop</li> </ul> </li> <li>B. Write true or false.</li> <li>2. Prenatal is the stage when the child changes from infant to toddler.</li> <li>3. During the infancy stage, the body becomes bigger and stronger.</li> <li>4. Members of the nuclear family include mother, father and children.</li> </ol>	(1 pt.)
