Activity: FACTORING

Part I. Recall the theorems learned to determine which of the possible roots are actual roots then use that to express the given in factored form.

1. $x^3 - 2x^2 - 5x + 6 = 0$

from list of possible roots:

1	
-1	
2	
-2	

3	
-3	
6	
-6	

Factored form: $(\quad)(\quad)(\quad) = 0$

2. $x^4 + 6x^3 + 7x^2 - 6x - 8 = 0$

from list of possible roots:

1	
-1	
2	
-2	

4	
-4	
8	
-8	

Factored form: $(x - 1)(\quad)(\quad)(\quad) = 0$

Part II. Which of the following do you prefer to use in helping you factor the polynomial?

☐
☐

Remainder Theorem

Factor Theorem

☐
☐

Rational Root/Zero Theorem

Synthetic Division

Why?

How many attempts? ____.
How well did you do?

Need help!

Just OK!

Splendid

I NEED TO...
