DEFINITION..

Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs.
"Brundtland Report" 1987.

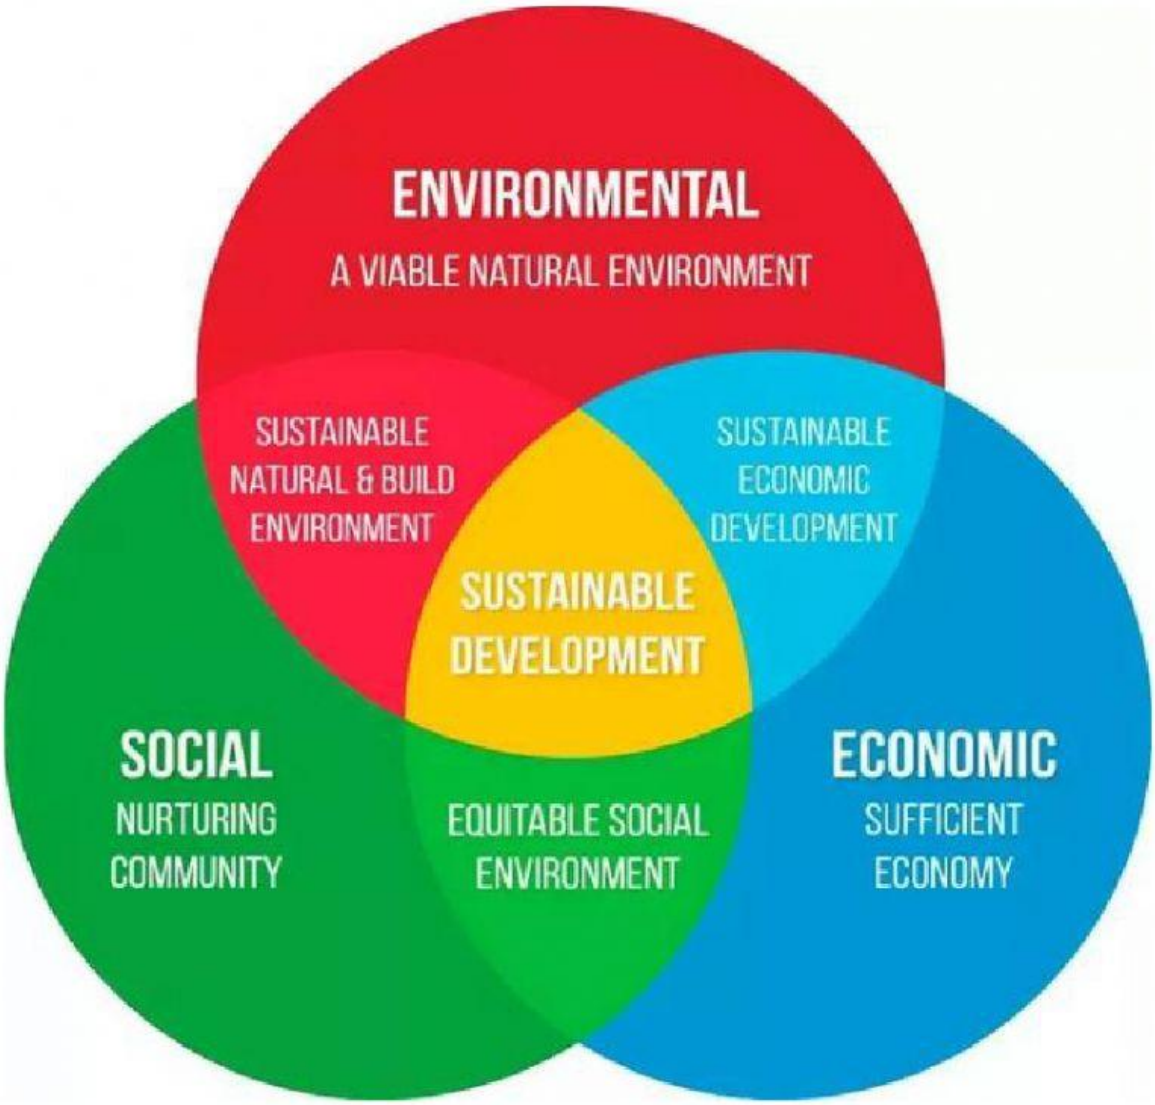

"Improving the quality of human life while living within the carrying capacity of supporting ecosystems" (Caring for the Earth, IUCN/WWF/UNEP, 1991)

It contains within it two key concepts:

- the concept of **needs**, in particular the essential needs of the world's poor, to which overriding priority should be given; and
- the idea of **limitations** imposed by the state of technology and social organization on the environment's ability to meet present and future needs."

All definitions of sustainable development require that we see the world as a system—a system that connects space; and a system that connects time.

LIVEWORKSHEETS
