

Read the article and answer the following questions.

SNOWSHOES—OR SNOW SHOVELS?

ANIMAL: COLLARD LEMMING

HABITAT: Sandy or gravelly areas

Collared lemmings are the only rodents whose coat changes to white. And they have another wild adaptation to winter: As snow starts to fall, lemmings grow oversize claws on the third and fourth toes of their front feet. This allows them to dig tunnels in the snow all winter. Staying below the surface helps them avoid predators while they shovel for food. By spring, their burrowing wears down their claws to a normal size.

WINTER

SUMMER

Answer the following questions based on the article.

1. What is the title of the article? _____
2. What animal is it? _____
3. Where does the animal live? _____
4. What is the color of the animal during summer?
