

POLAR BEAR (Ursis maritimus)

The polar bear is one of the eight different species of bears. Its habitat is the ice and water near the Arctic Circle. Bears are predators that eat other

animals. Their usual prey is other arctic animal, such as seals. They hunt for their food during the day.

They are wild animals and are found in the north of Canada. The problem is that they are vulnerable, and there are not many of them left. Their habitat is shrinking and many of them are dying. If we don't

protect endangered species, such as the polar bear, they will go disappear. If we don't care about global warming, their habitat will melt completely.

Fortunately, there are many ways to help them. If you recycle plastic and different materials, it will have a positive impact in the planet. If you donate money to different organizations, they will have funds to protect them...

1. Look at the highlighted words and write them next to the correct meaning.

- _____ The place where an animal usually lives
- _____ Animals that kill other animals
- _____ To keep safe.
- _____ A kind of animal
- _____ In nature and not controlled by people.
- _____ An animal that other animal kills to eat.

2. Answer about the text:

- How many species of bears are there?
- What's the problem with their habitat?
- Why is it necessary to protect endangered species?
- Mention one of the things you can do to help polar bears.

Well Done!
