Coronavirus disease (COVID-19) is an infectious disease caused by a new virus. The disease causes respiratory illness (like the flu) with symptoms such as a cough, fever, and in more severe cases, difficulty breathing. You can protect yourself by washing your hands frequently, avoiding touching your face, and avoiding close contact (1 meter or 3 feet) with people who are unwell.

Coronavirus disease spreads primarily through contact with an infected person when they cough or sneeze. It also spreads when a person touches a surface of an object that has the virus on it, then touches their eyes, nose or mouth.

People may be sick with the virus for 1 to 14 days before developing symptoms. The most common symptoms of coronavirus disease (COVID-19) are fever, tiredness, and dry cough. Most people (about 80%) recover from the disease without needing special treatment.

There's currently no vaccine to prevent coronavirus disease (COVID 19). You can protect yourself and help prevent spreading the virus to others if you wash your hands regularly for 20 seconds, with soap and water or alcohol-based hand rub. You cover your nose and mouth with disposable tissue or flexed elbow when you cough or sneeze. You avoid close contact (1 meter or 3 feet) with people who are unwell. You stay at home and self isolate from others in the household if you feel unwell.

Snakes are reptiles (cold-blooded creatures). They belong to the same group as lizards (the scaled group, Squamata) but from a sub-group of their own (Serpentes). Snakes have two legs but a long time ago they had claws to help them slither along. Snakes are not slimy. They are covered in scales which are just bumps on the skin. Their skin is hard and glossy to reduce friction as the snake slithers along the ground.

Snakes often sun bathe on rocks in the warm weather. This is because snakes are cold-blooded; they need the sun's warmth to heat their bodies up. Most snakes live in the country. Some types of snakes live in trees, some live in water, but most live on the ground in deserted rabbit burrows, in thick, long grass and in old logs.

A snake's diet usually consists of frogs, lizards, mice and other snakes. The Anaconda can eat small crocodiles and even bears. Many snakes protect themselves with their fangs. Some snakes are protected by scaring their enemies away like the Cobra. The flying snakes glide away from danger. Their ribs spread apart and the skin stretches out. Its technique is just like the sugar gliders.

On a hot day of summer, an ant was searching for some water. After walking around for some time, she came near the river. To drink the water, she climbed up on a small rock. While trying to drink water, she slipped and fell into the river.

There was a dove sitting on a branch of a tree who saw an ant falling into the river. The dove quickly plucked a leaf and dropped it into the river near the struggling ant. The ant moved towards the leaf and climbed up onto it. Soon, the leaf drifted to dry ground, and the ant jumped out. She looked up to the tree and thanked the dove.

Later, the same day, a bird catcher nearby was about to throw his net over the dove hoping to trap it. An ant saw him and guessed what he was about to do. The dove was resting and he had no idea about the bird catcher. An ant quickly bit him on the foot. Feeling the pain, the bird catcher dropped his net and let out a light scream. The dove noticed it and quickly flew away.
