

# HOT AIR BALLOONS

Fill in the blanks with the correct form of the root word on the right.

Riding in a hot-air balloon is a (1) \_\_\_\_\_ calm and peaceful experience, quite (2) \_\_\_\_\_ any other form of flying. With no engines to provide power, a balloon depends (3) \_\_\_\_\_ on the winds around it to move in any directions. (4) \_\_\_\_\_, the maximum speed is normally around 15 kilometers per hour.

This kind of balloon is based on the simple (5) \_\_\_\_\_ principle that the (6) \_\_\_\_\_ of hot air is less than that of cold air. It is not, however, a large (7) \_\_\_\_\_, as a cubic meter of hot air is only about 250 grams lighter than the same amount of cold air. This means it takes (8) \_\_\_\_\_ four cubic meters of hot air just to lift one kilo, which explains why balloons that carry people have to be so enormous.

A gas burner is used to (9) \_\_\_\_\_ the air inside the balloon, causing it to rise. To go up more slowly or to make a (10) \_\_\_\_\_, hot air is released from the top of the balloon. The fact that the wind blows in different directions at different heights (11) \_\_\_\_\_ the pilot to steer the balloon left or right by moving it to higher or lower positions in the sky.
