

LINES, RAYS, ANGLES Song!

Listen to the song (click on the image) and fill in the gaps:

We're about to have some fun. What's going on, everybody?
Welcome to the McCarthy math Academy. Geometry series.
This is part one of four.

Who's ready to be a Geometry Genius? All right, then listen to this one over and over until you know it by heart!. You know I love me, know, I love me some geometry. Watch me bust out that geometry vocabulary.

I'm not gonna disappoint. I'll get right to the point.

What's your ? an exact spot in space!

And like it or not it kind of looks like a dot. Oh, my gosh, you're right. Join it to the end of a , and guess what it's called? I don't know.

An ? That's right. Now let's define a .

A straight path that never, ever stops on each side. Stop that line.

A will help you dreams come true. Smack attacks with two endpoints on the back. Take one away.

And, hey, you've got a !

Wrangle two rays or line segments together to form an

Some angles that you need to know:

and straight are the four.

A right angle, you see, is a square corner of degrees.

An acute is so cute like a little baby. And acute angle is 90.

Yo, dude, I'm . How did he get loose? Excuse me.

Some people think I'm cute, geez, Anyway, I'm wider than a right with my arms open wide, ready for the best hug you've ever had in your life, right? Oh, it's not up for debate. My hugs are great.

And, hey, I'm late for a date. Oh, wait, one last chance for me to educate. He's kinda overrated.

Everybody meet

Wait, a straight line is an angle?

Don't get your angles tangled. So what I was thinking, you know

how teachers, they say, all right, class, go ahead and

at the door. Well, hold up a SEC, because we've got a line leader and a caboose at the end, which means that we have two .

That's not a !. So maybe next time the teacher should say, up!.

Take two lines and make them cross. Now they're .

Criss, cross. They intersect and make angles that are right.

Per-Per-Per lines.

What if they never, ever crossed like a railroad track?

That'd be swell, if there was well a special name for that. Well, consider this your lucky day, boss.

They call them lines because they never, ever cross. You know, I love me, know I love me some geometry,

watch me bust out that vocabulary.

I'm. You know, I love me, know I love me some geometry.

Watch me bust out that geometry .

See you in part two!
