Unitary Method #2

When you are finding the value for ONE item or quantity, DIVIDE.

Example: If 6 apples cost $9.60, what will be the cost of 1 apple?

6 apples = $9.60

1 apple = $9.60 ÷ 6 = $1.60

Complete the following.

a) 3 boxes have 24 cherries. 1 box will have _____ cherries.

b) 2 bags have 68 oranges. 1 bag will have _____ oranges.

c) 4 shelves hold 168 cans. 1 shelf will hold _____ cans.

d) 6 packs have 846 pencils. 1 pack will have _____ pencils.

e) 5 containers hold 65 litres. 1 container will hold _____ litres.

f) 8 similar bags have 824 apples. 1 bag will have _____ apples.

g) 4 pens cost$12.16. 1 pen will cost _____

h) 7 books cost $14.00. 1 book will cost _____

i) 906 stickers are shared equally among 6 boys. How many stickers will each boy get?

_____

j) If 2 books have 246 pages, how many pages are there in 1 book? _____

k) If 3 similar bags have 639 oranges altogether, calculate how many oranges are in each bag. _____

l) 4 similar chickens weigh 416 kg. Calculate the weight of 1 chicken. _____

m) If 2 apples cost $8.50, what is the cost of 1 apple? _____
