*Read the following passage and mark the letter A, B, C or D on your answer sheet to indicate the best option for each of the blanks from 36 to 40.*

A natural disaster is a major adverse event resulting (36) \_\_\_\_\_ natural processes of the Earth; examples include floods, hurricanes, tornadoes, volcanic

eruptions, earthquakes, tsunamis, storms, etc. A natural disaster can cause loss of life or damage property, and typically leaves some economic damage in its wake, the severity of which depends on the affected population's resilience and on the infrastructure available.

In (37)\_\_\_\_\_times, the divide between natural, man-made and man-accelerated is quite difficult to draw with human choices like architecture, fire, resource management or even climate change potentially playing a role. An adverse event will not rise to the level of a disaster if it occurs in an area without vulnerable population. In a vulnerable area, however, such as Nepal during the 2015 earthquake, an adverse event can have (38)\_\_\_\_\_disastrous consequences and leave lasting damage, which can (39)\_\_\_\_\_ years to repair. The disastrous consequences also impact the mental health of effected communities often leading to post-traumatic symptoms. These emotional experiences can be supported through collective processing, leading to (40)\_\_\_\_\_and increased community engagement.

### **Pandemics**

Diseases are a natural part of life on Earth. If there were no diseases, the population would grow too quickly, and there would not be enough food or other resources. So in a way, diseases are nature's way of keeping the Earth in balance. But sometimes they spread very quickly and kill large numbers of people. For example, in 1918, an outbreak of the flu spread across the world, killing over 25 million people in only six months. Such terrible outbreaks of a disease are called pandemics.

Pandemics happen when a disease changes in a way that our bodies are not prepared to fight. In 1918, a new type of flu virus appeared. Our bodies had no way to fight this new flu virus, and so it spread very quickly and killed large numbers of people. While there have been many different pandemic diseases throughout history, all of them have a few things in common.

First, all pandemic diseases spread from one person to another very easily. Second, while they may kill many people, they generally do not kill people very quickly. The flu virus of 1918, generally took about a week to ten days to kill its victims, so it had more time to spread.

While we may never be able to **dead** stop pandemics, we can make them less common. Doctors carefully monitor new diseases that they fear could become pandemics.
