

Line of symmetry

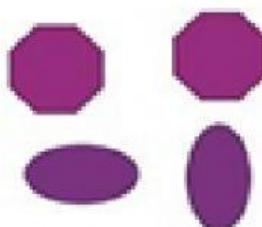

A line of symmetry is an imaginary line that divides a plane shape into equal halves. When a shape can be evenly divided into equal parts, it is said to be symmetrical. A shape can have one or more lines of symmetry. A shape can also have no lines of symmetry. When a shape has no line of symmetry, it is said that the shape is not symmetrical.

LINES OF SYMMETRY

Congruent Shapes

Congruent shapes are shapes that are exactly the same. They have the same size and shape. Shapes that are different are not congruent.

Shapes that are the same, but have different sizes are said to be similar.
