

## The Water Cycle

Drag and drop the correct answer from the word bank below to fill in the paragraph.

atmosphere	condensation	heavy	cold
Heat	water	Evaporation	clouds
precipitation			

The Sun's \_\_\_\_\_ changes water from the Earth's oceans into \_\_\_\_\_ vapour. This part of the water cycle is called \_\_\_\_\_.

The invisible vapour rises into the \_\_\_\_\_, where the air temperature is cold. The \_\_\_\_\_ air causes the vapour to change into water droplets and \_\_\_\_\_. This part of the water cycle is called \_\_\_\_\_.

The clouds get heavier and heavier with water droplets. When the droplets are \_\_\_\_\_ enough, they begin to fall from the clouds as \_\_\_\_\_.

The cycle then starts again.
