

## Newton's laws worksheet 5

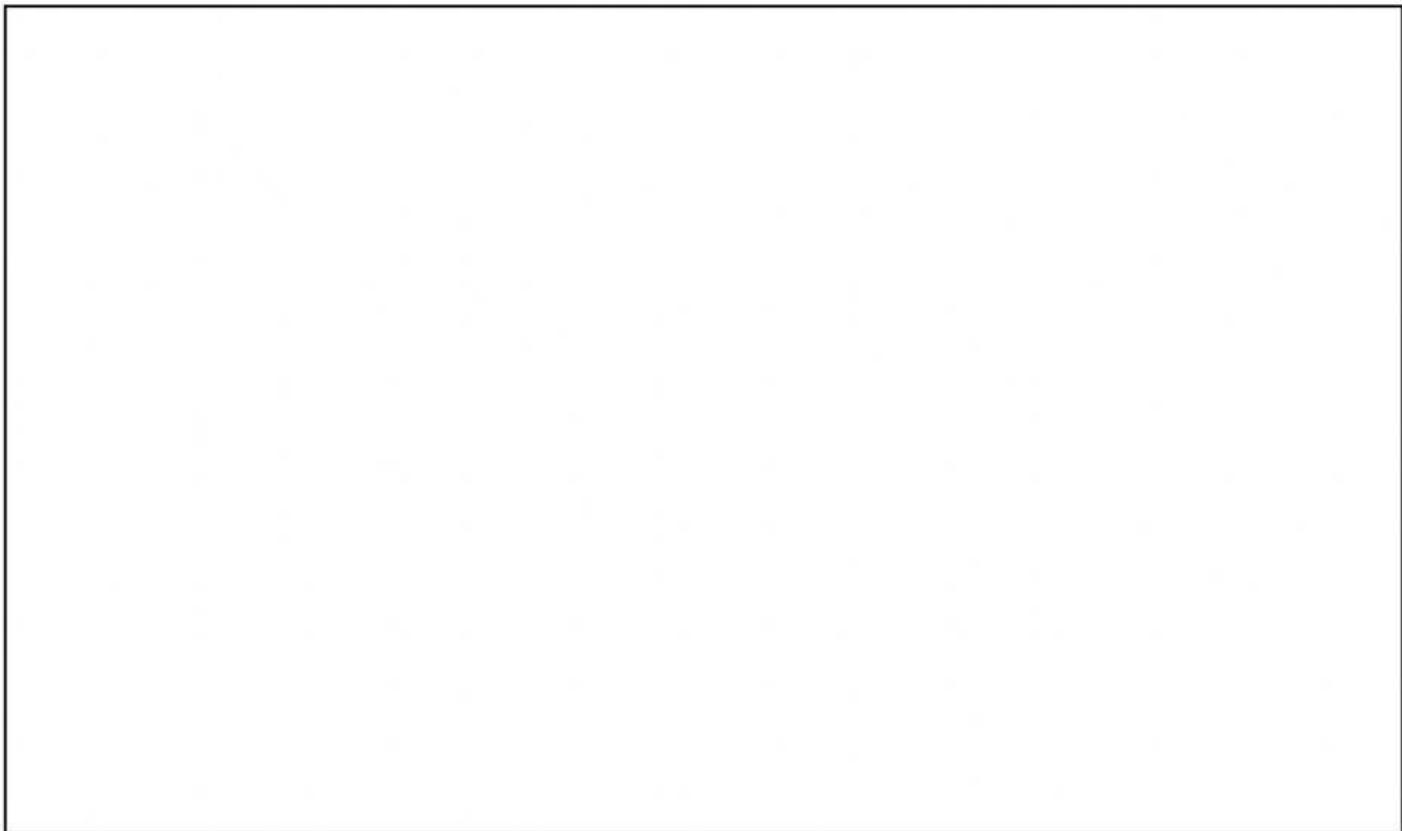

### Calculating the components of a force

Calculate the horizontal and vertical components of the forces

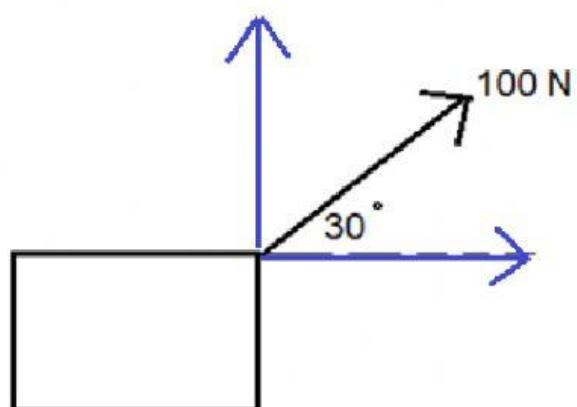

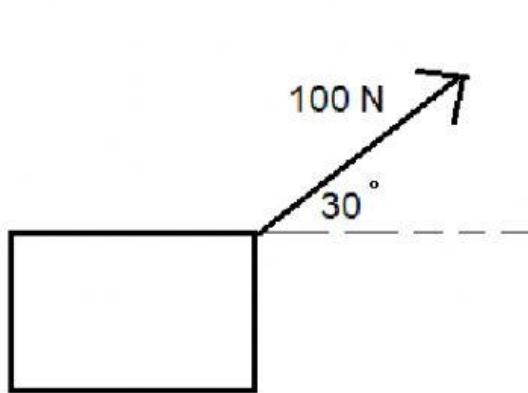

If an object is pulled at an angle then it is useful to break that force up into components.

It is tricky to work with forces at an angle

Watch this video to calculate the components of a force

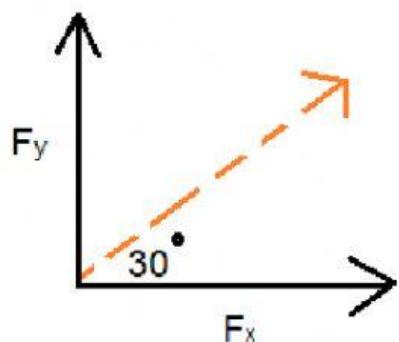

Eg 1. If a box is pulled up with a force of 100 N at an angle of  $30^\circ$  with the horizontal

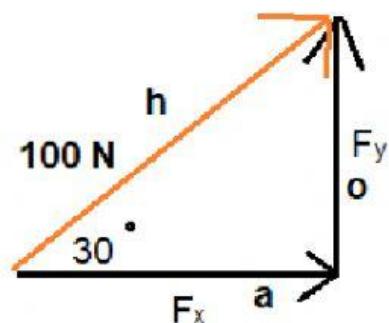

Instead of one person pulling the box with a force of 100 N at an angle of  $30^\circ$  - it can be broken up into two forces. One person pulling it to the right and one person pulling it up.

These 2 forces combined will have the same effect as one person pulling it with 100N at an angle. Essentially what we are doing is working backwards. It's like they have given us the net/resultant force and we have to work backwards and find the horizontal and vertical forces that made it.

To do this draw these forces into a vector triangle

The two components need to be drawn head to tail though

We want the  $F_x$  and  $F_y$  components

We have the hypotenuse and need the adjacent and opposite sides

### To calculate the Fy component

$$\sin \Theta = \frac{o}{h}$$

$$\frac{\sin 30}{1} = \frac{Fy}{100}$$

*cross multiply first*

$$\sin 30 (100) = Fy$$

$$Fy = 50 \text{ N upwards}$$

### To calculate the Fx component

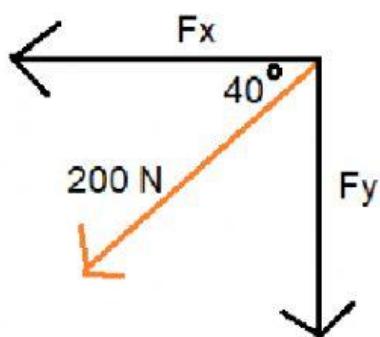

$$\cos \Theta = \frac{a}{h}$$

$$\cos 30 = \frac{Fx}{100}$$

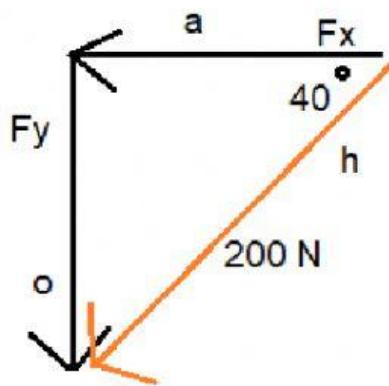

$$\cos 30 (100) = Fx$$

$$Fx = 86,60 \text{ N right}$$

Eg 2. If a box is pushed down at an angle with a force of 200 N at an angle of 40° with the horizontal.

You need to redraw the forces into a triangle first.

**To calculate the Fy component**

$$\sin \Theta = \frac{o}{h}$$

$$\frac{\sin 40}{1} = \frac{Fy}{200}$$

*cross multiply first*

$$\sin 40 (200) = Fy$$

$$Fy = 128,56 \text{ N upwards}$$

**To calculate the Fx component**

$$\cos \Theta = \frac{a}{h}$$

$$\cos 40 = \frac{Fx}{200}$$

$$\cos 40 (200) = Fx$$

$$Fx = 153,20 \text{ N right}$$

There is a little shortcut you can take, so that you don't need to draw the triangle every time.

**Y sin if you can cos X**

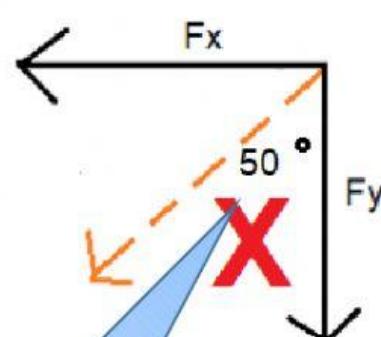

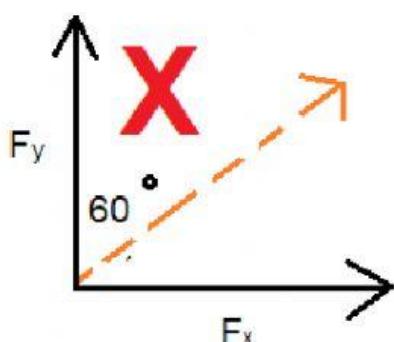

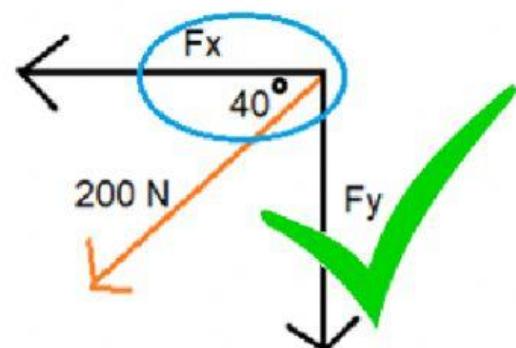

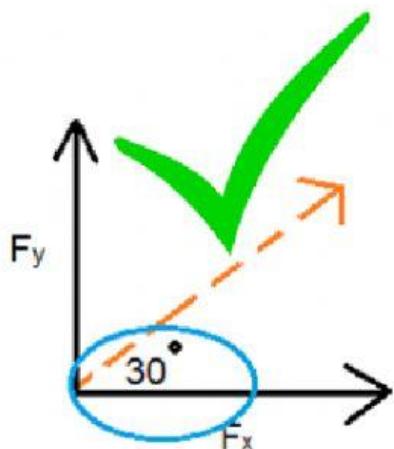

{why sine if you can cos x}

This way you can always calculate  $F_x$  and  $F_y$  as follows:

$$F_y = F \cdot \sin \Theta$$

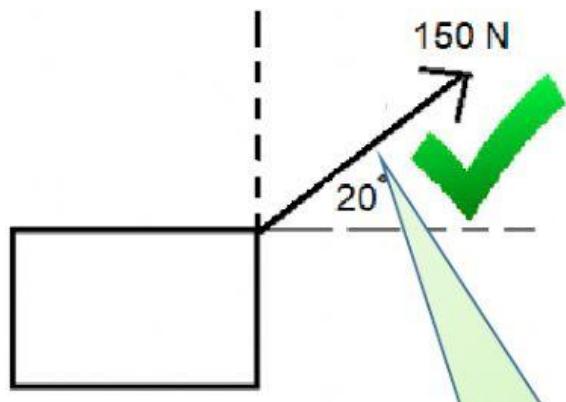

$$F_x = F \cdot \cos \Theta$$

**However** the  $\Theta$  must be the angle made with the horizontal (or x-axis)

Don't use these angles, that are next to the y-axis. If you are given these angles then you must subtract them from  $90^\circ$  and then use the angle made with the x-axis.

Eg 3. Calculate the horizontal and vertical components of the following:

$$F_y = F \cdot \sin \Theta$$

$$= 150 (\sin 20)$$

$$= 51.30 \text{ N upwards}$$

$$F_x = F \cdot \cos \Theta$$

$$= 150 (\cos 20)$$

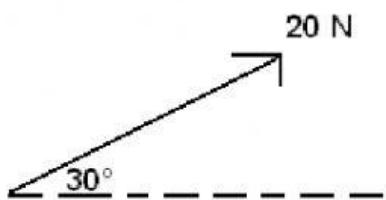

$$= 140 \text{ N right}$$

This is the correct angle to use with the shortcut since it is the angle made with the x-axis

### Exercise 5: Calculate the horizontal and vertical components of the following

- ✓ Round each answer off to 2 decimal places
- ✓ remember that force is a vector and needs direction and magnitude

5.1

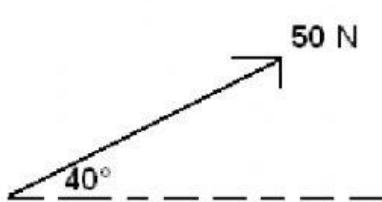

$F_x =$  \_\_\_\_\_

Answer value and unit

Direction

$F_y =$  \_\_\_\_\_

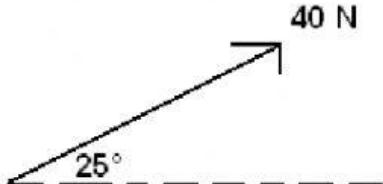

5.2

$F_x =$  \_\_\_\_\_

$F_y =$  \_\_\_\_\_

5.3

$F_x =$  \_\_\_\_\_

$F_y =$  \_\_\_\_\_

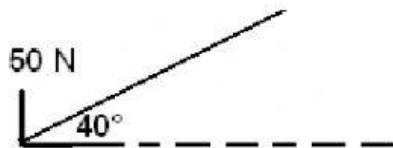

5.4 A lawnmower is pushed with a force of 25 N downwards at an angle of  $35^\circ$  to the horizontal.

$$F_x = \underline{\hspace{2cm}} \underline{\hspace{2cm}}$$

$$F_y = \underline{\hspace{2cm}} \underline{\hspace{2cm}}$$

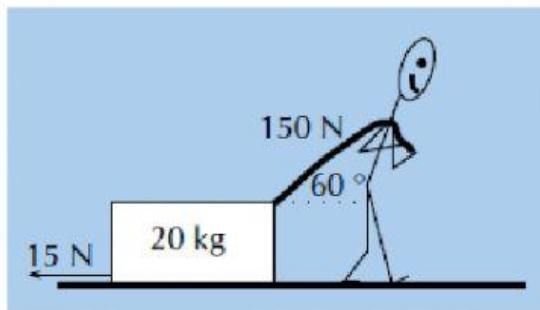

5.5 A lawnmower is pushed with a force of 50 N downwards at an angle of  $40^\circ$  to the horizontal.

$$F_x = \underline{\hspace{2cm}} \underline{\hspace{2cm}}$$

$$F_y = \underline{\hspace{2cm}} \underline{\hspace{2cm}}$$

5.6

$$F_x = \underline{\hspace{2cm}} \underline{\hspace{2cm}}$$

$$F_y = \underline{\hspace{2cm}} \underline{\hspace{2cm}}$$
