PUT THE SENTENCES INTO THE CORRECT TIMELINE

Dan is having a picnic. He sips his juice through a bright orange plastic straw.

Dan's favourite food is fish and chips.

In the sea, plastics break up into tiny pieces called microplastics. These are less than 5mm in size.

Unfortunately, Dan does not pick up all the litter from his picnic. The straw blows into the gutter by the road.

After being eaten by minute organisms such as zooplankton, microplastics can pass up the food chain, from smaller fish to bigger fish, and eventually to us.

Fish are caught and sold to people who eat them for dinner.

When it rains, litter is carried away down the drain. It ends up in the river which flows into the sea.

Zooplankton, tiny animals that live in the sea, can eat microplastics.
