

## LISTEN AND FILL IN THE GAPS

You thought smart glasses were a flop? We did too!

But it \_\_\_\_\_ be time to reconsider.

In this episode of *Smart Tech* we're looking \_\_\_\_\_ the future of hands-free technology.

This version of the glasses is \_\_\_\_\_

obtrusive than the first iteration. The glasses

\_\_\_\_\_ like, well, glasses! With an almost

invisible \_\_\_\_\_ and texts transmitted

directly onto your retina, there's almost no telling that you're

answering an e-mail or making dinner reservations. The

\_\_\_\_\_ and \_\_\_\_\_ screen have been replaced with \_\_\_\_\_

commands and eye gestures.

The glasses link up with all your other tech seamlessly, so you can

\_\_\_\_\_ data from your smart watch, or make a phone call just by

swiping with your eyes. How much will it run you? Ay, there's the

rub! This retooled version should be retailing in the range three to

four times the price of a top of the line smartphone, which prices out

all but the most \_\_\_\_\_ tech \_\_\_\_\_.

However, the next version should see more accessible pricing and fewer bugs. Our

verdict: a huge \_\_\_\_\_ over the first version, but it might be

\_\_\_\_\_ to wait for prices to come down out of the stratosphere.
