Read the text and complete with the words below

caries- patients- health- exam- ate- healthcare-acids- nutrition- homeschooled- dentist-
vegan- repair- decalcification- combination- hygiene

Dentists can play a pivotal role in improving patients' dietary _____ (1). But is nutritional counseling really within a dentist's scope of practice?

At her trial in Elk Grove, California, Sireesha Penumetcha, DDS, MAGD, LLSR, and FICOI, sees a family whose members are pictures of health. The mother is a nutritionist. The kids are _____ (2), so they don't have access to soda and candy in cafeteria vending machines. The family followed a _____ (3) diet and had a sparkling oral health history with no _____ (4) or _____ (5).

But a strange thing happened.

During a recent preventive _____ (6), Penumetcha discovered that the previously caries-free children all had tooth decay.

The family practised good oral health _____ (7) and had a nutritious diet, so Penumetcha wondered what changed. She discovered it wasn't what the family ate but rather how they ate that created problems.

"They juiced their vegetables and fruits," Penumetcha said. "Even though the food is healthy, the form in which they _____ (8) it produced a strong _____ (9) of fruit acids and sugars."

Penumetcha could have simply treated the symptom. But, by digging a bit deeper, she identified the real issue and educated her patients about how to prevent it.

"The old concept of dentistry is to restore and _____ (10) teeth and gums," Penumetcha said. "But now, we need to focus on education, prevention and maintenance more than just drilling and filling teeth. The first step toward any treatment should be finding the underlying root cause, which is nutrition and habits."

Discussing nutrition with patients may feel like you're blurring the lines between dentistry and dietetics, but it could provide a clear pathway toward integrating dentistry as a crucial component of whole-body _____ (11).

For Penumetcha, _____ (12) is an important aspect of oral and systemic health. She doesn't shy away from dietary conversations, as they help her achieve her practice goal of addressing "the complete foundation of health" for her _____ (13).

"We have always educated and advised our patients regarding the effects of soda, _____ (14) on teeth — including fruit acids — and not brushing following snacking," she said. "Overall health begins with oral health. Thus, proper nutrition and habits are equally important for oral health."

How does a general _____ (15) who has no nutrition background have these conversations with patients? A comprehensive refresher in key oral health and nutrition concepts is a good place to start.

2- Fill in the blanks with the correct words or phrases:

plaque- adolescence- habits- fluoride- accumulates- preventative care- hygiene- environment

1. The bright colours at the dental practice create a pleasant _____ for children.
