Life Cycle of a Moss Plant

Arrange the following events in the correct order.

	Male moss plants produce sperm cells and female moss plants produce egg cells
	A spore case grows out of the moss (sporophyte)
	Spores are carried by the wind into a suitable habitat where they grow into new moss plants (gametophyte)
	Water carries the sperm cells to the female moss plant where fertilization occurs
1	The spore case ripens and dries out and the spores are released

Life Cycle of a Fern Plant

Arrange the following events in the correct order.

	A young fern plant (fiddlehead) grows and develops fronds with spore cases
	The spore produces a tiny heart-shaped plant that has the male and female reproductive organs (gametophyte)
1	The spore cases on the underside of a frond mature and spores are released.
	Water transports the sperm cells to the egg cells and fertilization occurs
