

When water vapour
rise_, it condense_
and turn_ into tiny
droplets that form
into clouds.

The heat from the sun
make_ water
evaporate and rise
into the atmosphere
as gas or water
vapour

When water droplets
come together, they
become bigger and form
clouds. Precipitation
fall_ to the Earth in the
form of rain, snow or
sleet.

Precipitation can accumulate
in two ways. it can seep
underneath the Earth's surface
and become groundwater or
flow on the surface of the Earth
as surface water. It include_
rivers which end at the sea.
When it do_, the water cycle
begin again.
