Science and technology

Choose the correct words to complete the blog.

I really didn't enjoy science lessons much when I was younger. I hated **(1) making / doing** experiments in the laboratory because I was very clumsy and I always did something wrong – like drop a test tube or get my **(2) measurements / explorations** all wrong! Also, I was hopeless at **(3) taking / keeping** a record of my work – I just wasn't very organised. But recently I've started to get very interested in what we're doing. We had to **(4) make / do** some research for a project and then report our **(5) findings / proof** to the class. We had to **(6) analyse / hypothesise** all sorts of problems and test different **(7) results / theories**. It was hard work but fascinating. Last week we went to a science show in London where they have all the latest **(8) devices / gadgets**, including a **(9) robot / battery** that can serve meals in a restaurant! You can operate it with a **(10) removed / remote** control. Cool! I admire people who can **(11) invent / discover** clever things like that or **(12) make / do** really important discoveries like penicillin and antibiotics. I've been doing some advanced computer training, too. Before it all I could do was **(13) post / send** emails and do some basic word **(14) producing / processing** like create and **(15) edit / install** files. I knew how to **(16) save / back** my work OK, but that was about all. Now I've learned things like how to design **(17) servers / websites**, and I can fix problems caused by computer **(18) viruses / infections**. So, maybe in the future I can have a career in some **(19) arm / branch** of science and change the world a bit! Who knows?
