

The Moon

The Moon is the Earth's only natural satellite. The Moon does not shine with its own light. It simply reflects light coming from the Sun.

Phases of the Moon

Ever noticed how the Moon appears to change shape each night? That's because as the Moon orbits the Earth, the Sun lights up different parts of its surface - so it's just our view of the Moon that's changing, not the Moon itself.

1. Match the phases of the Moon with the picture.
