Seed Germination

Match the number with the steps of growing plants!

1

The seed absorbs water from the soil. After some time, the skin of the seed breaks a little. A small root will grow from the seed.

2

The roots begin to appear clearly and grow downwards. The bud starts growing upwards. This young plant is now known as a seedling.

3

The stem grows above the soil. The shoots and first leaves appear. The roots grow longer.

4

More leaves will grow to help the plant to make food. More roots will grow to help it to absorb water and nutrients from the soil

Soon, it will become an adult plant with flowers and fruits!
