DRAG-AND-DROP CELL ORGANELLES

Match each structure with it's function by dragging the organelles to their proper spaces.

Structures	Functions
ribosome	Stores water and ions.
lysosome	Produces enzymes to digest bacteria.
chromosomes	Produces proteins.
centriole nucleus	Internal support system for cell.
mitochondrion	Packages proteins into vesicles.
cytoskeleton	Transport system inside cell.
endopl. reticul.	Control centre of cell.
protoplasm golgi body	Long tail-like structure for cell locomotion.
flagellum	"Powerhouse" of the cell (produces ATP).
vacuole	Site of photosynthesis.
chloroplast cell membrane	Stores starch in plant cell.
nucleolus	Produces spindle fibres for mitosis.
am yloplast	Supports all cell organelles.
	Semipermeable to control entry and exit of materials.
check	Produces ribosomes.
	Genetic material in nucleus.
