

You are going to use pseudocode to write the algorithm for the following scenario.

Scenario:

Ask a use to input their name and age and display different messages based on the age entered. For ages under 12 print you are just a kid, for ages between 12 and 18 print you are a teenager for ages between 19 and 75 print you are an adult and for ages over 75 print you are a senior citizen.

In each box select the pseudocode that you think is correct for that stage:

```

Input your name
Input your age
Begin
Print you are a senior citizen
Else if age >19 or <75
Else If age < 12 then
If age > 75 then
End
Else if age >12 And <18 then
print you are a teenager
print you are an adult
print you are just a kid
End if

```

This image shows a single sheet of white paper with horizontal dashed lines, commonly used for handwriting practice in elementary schools. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.
