

Jupiter and Earth

Nine planets go around the Sun. Earth is one of these planets. Earth is the third planet in the solar system, Jupiter is the fifth one.

Jupiter is like a giant compared with earth. Jupiter is 1000 times bigger than earth which spins on its axis one time every 24 hours. Jupiter does the same thing in less

than 10 hours. Jupiter spends 12 years going around the sun one time; earth spends 365 days and four hours doing this.

Jupiter is covered for an ocean; scientists believe that the ocean could be 10,000 miles deep! Don't even think about swimming in it! You will get frozen inside your swimsuit.

The temperature in Jupiter is way lower than the temperature in earth; in Jupiter temperature could be lower than 250°F.

Answer the questions correctly.

- 1) How is Jupiter different from earth?
- 2) How are Jupiter and earth similar?
- 3) In this article Jupiter is compared with
- 4) Temperature in Jupiter is...
- 5) The main idea of the article is...
