

## READING

### Read the text about "Falling stars"

Sometimes people see lines that move in the sky. They call them "falling stars" or "shooting stars". They use a telescope to see them because they are far away. But, they are not stars. They are pieces of stone or iron that fall from the sky. Most of them are very small, and when they come to the earth, they are so bright and hot that they burn. The big stones that fall to the earth are called meteorites. They look like balls of fire

Complete the table with opposite adjectives from the text. Then, complete with two additional adjectives.
