

Identify the kinds of plants.

Tree

shrub

herb

vine

A \_\_\_\_\_ is a woody plant that can grow tall. Its main stem is called trunk. The trunk gets thicker each year to support the plant. Its roots are long and big. The roots spread out or grow deep into the ground.

A \_\_\_\_\_ is smaller than a tree. It also has hard and woody stems. Several stems grow from the ground.

A \_\_\_\_\_ has soft or hard stems. It climbs up towards the light with the help of a stick or trellises. Long tendrils grow from their stems. When a tendril touches its support, such as a stick, its tip starts to twist and curl around it

An \_\_\_\_\_ is a plant with soft stems. It is not woody like a tree or shrub.
