

# Gravity, Mass and Weight

mass	mass	gravity	arrows
matter	size	direction	six
ten	attraction	distance	

Gravity is the force of \_\_\_\_\_ between any two objects that have \_\_\_\_\_. The strength of the attractive force depends on two things the \_\_\_\_\_ of the objects and the \_\_\_\_\_ they are from each other.

The mass of the Earth is six times the mass of the moon, because of this the Earth exerts \_\_\_\_\_ times the gravitational pull of the moon. Weight is a measure of \_\_\_\_\_, whereas mass is a measure of the amount of \_\_\_\_\_ in an object. If an object weighs sixty N on Earth, it would weigh \_\_\_\_\_ N on the moon.

\_\_\_\_\_ are used to represent forces. The arrows tells us two things about the force, it tells us the \_\_\_\_\_ of the force and the \_\_\_\_\_ of the force.

Drag the Force Arrows to where they belong.
