Separating Mixtures

filtration	To separate out a mixture of liquid and solid, collecting both parts, e.g. pure water from ink, or sea water.	Insoluble materials won't pass through the tiny holes of the filter paper and so are separated from the soluble materials.	
			To separate out a mixture of dissolved solids from a liquid e.g. salt water (this method collects the solid only).
	distillation	As the liquid is heated it will evaporate and rise. It is then cooled and returned to liquid to be collected. Any solids will remain in the flask.	The water will evaporate as steam when heated, leaving behind the soluble materials in the base of the dish.
	evaporation	To separate out a mixture of soluble and insoluble solids, e.g. rock salt.	

Organise the different methods of separating a mixture into the table below. Click on the boxes and drag them to the correct place in the table. Use the colour of the boxes to help you.
