Weather

Weather scientist – Meteorologist, use all sorts of machines and equipment to predict the weather. Let us learn about 3 of them.

1. A **THERMOMETER** measures the air temperature. It tells how hot or cold the place is. We measure temperature in degrees Celsius or $^{\circ}\text{C}$.

2. A **BAROMETER** measures air pressure. It tells you whether or not the pressure is rising or falling. A rising pressure means sunny and dry conditions, while a falling barometer pressure means stormy and wet conditions.

Thursday 21st January 2021

3. An **ANEMOMETER** measures wind speed. The cups catch the wind, turning a dial attached to the instrument. The dial shows the wind speed.
