

Using the words below, fill in the blanks about how vaccines work.

immune	antibodies	injecting	virus
--------	------------	-----------	-------

Vaccinations work by a very small amount of the or bacteria that causes a certain disease into the body. It is a small enough amount so that it does not make you ill.

This makes the body's system create antibodies to fight off the injected disease. Then, if the disease enters your body again in the future, your immune system knows what it is and already has the to fight it. This is called immunity.
