

HOW DRUGS ARE STUDIED

Words

Look for the following words as you read the passage. Match each word with its correct definition.

Words

1. absorb
2. alleviate
3. ascertain
4. chronic
5. combat
6. culture
7. deem
8. desirable
9. enhance
10. fraction
11. interval
12. investigation
13. manufacture
14. monitor
15. outcome
16. recur
17. substance
18. target
19. theoretical
20. toxic

Definitions

- A. v., to improve
- B. n., a small part
- C. v., to produce
- D. v., to lessen, ease
- E. v., to take in
- F. n., result
- G. adj., poisonous
- H. v., to believe; judge
- I. v., to watch; observe
- J. v., to focus on
- K. v., to happen or occur again
- L. adj., long-lasting
- M. n., a study
- N. adj., abstract; based on theory
- O. v., to determine; find out
- P. n., the growing of organic materials in a laboratory setting
- Q. n., the period between two times or events
- R. n., material
- S. v., to fight against
- T. adj., wanted; worth having

Reading

How Drugs Are Studied

A

It takes years, and sometimes decades, for a drug to move from the **theoretical** stage to the pharmacy shelf. Of the thousands of drugs under **investigation** at any one time, only a small **fraction** will produce the desired result without unacceptable side effects.

B

First, scientists **target** a step in the disease process where they believe a drug can have an effect. Then they **manufacture** compounds or take them from organisms such as viruses and fungi and test them in laboratory **cultures**. Once scientists isolate a chemical that produces a **desirable** effect, they analyze¹ its structure and alter it as necessary to **enhance** the outcome.

C

The next step involves testing the drug in animals. Scientists look at how much drug is **absorbed** into the bloodstream, how it distributes to different organs, how quickly it is excreted or leaves the body, and whether it has any **toxic** effects or by-products. Researchers usually test at least two animal species because the same drug may affect species differently.

D

If a chemical passes laboratory and animal testing and is **deemed** appropriate to analyze in human volunteers, it is ready for clinical trials. Researchers follow a protocol that describes who may participate in the study, tests and procedures to follow, the length of the study, and **outcomes** to be measured. Drug trials may focus on treating a disease, preventing a disease from occurring or **recurring**, or **enhancing** the quality of life for people living with incurable, **chronic** conditions.

E

There are four phases of clinical trials; the first three phases study whether the drug is effective and can be safely administered to patients, and the fourth phase evaluates long-term safety and use once a drug is on the market.

F

Phase I clinical trials test a drug in small groups of healthy volunteers (fewer than 100) to **ascertain** its safety and the appropriate dose range. These studies last for six months to one year.

¹BrE: analyse

G

Phase II clinical trials test several hundred volunteers to determine how effectively the drug **combats** the disease being studied. These trials continue to evaluate safety, side effects, and optimal dose. Phase II studies also last for six months to one year.

H

Phase III trials test thousands of volunteers for several years, with researchers closely **monitoring** study participants at regular **intervals**. These studies typically compare the drug under **investigation** with a control: either a drug known to cure or **alleviate** a specific disease or, if one does not exist, a **substance** that has no medicinal effects, known as a placebo. Phase III trials are typically blind studies (participants do not know which drug they are receiving) or double-blind studies (neither participants nor researchers know which drug an individual is receiving until the trial is completed).

I

Once a drug passes the first three phases and is found to be safe and effective, drug companies may apply for the right to market the product. After a drug is approved and on the market, Phase IV trials may investigate longer-term effects, effects in different groups of patients such as the elderly, or use of the medication for a different condition such as using a cancer drug to treat AIDS.

Answer the questions about **How Drugs Are Studied**.

Questions 1–4

*The reading passage contains nine paragraphs, A–I.
Which paragraph discusses the following information?
Write the correct letter, A–I.*

- _____ 1. Drug tests that involve growing biological material in a laboratory
- _____ 2. Investigations of the effects of drugs on animals
- _____ 3. Studies to determine how safe a drug is and how much a patient should take
- _____ 4. Studies to monitor how well a drug fights a disease

Questions 5–7

Choose the correct letter, **A**, **B**, **C**, or **D**.

5. Drug tests on animals look at
A how the drug is absorbed by the body.
B how effective the drug is for chronic conditions.
C how well the drug prevents a disease from recurring.
D how quickly the drug alleviates the disease.
6. During Phase II clinical trials, study participants are monitored for
A chronic conditions.
B toxic doses.
C speed of cure.
D possible side effects.
7. After a drug is deemed safe and effective, a drug company may do further tests to ascertain
A the best way to market it.
B possible effects over time.
C how it compares with other drugs.
D the best group of people to use it.
