## 2. Read the passage and tick True (T), False (F) or not mentioned (NM).

### Nutrition

Nutrition is the process of how people get the food that is needed to grow strong and healthy. For children, good nutrition is especially important and it is necessary to eat healthy foods because kids are constantly growing. Good nutrition will lead to healthy bones and muscles. Without receiving the correct vitamins and nutrients while growing, a child will not be as tall and strong as they could be.

There are five main food groups that we should eat every day. The first food group includes grains such as breads, cereals, pasta, and rice. The second food group is dairy, including milk, cheese, yogurt, and other dairy products. Apples, oranges, grapes, bananas, and much more are a part of the third food group, fruits. Of course, vegetables is in its own food group as well. There are many vegetables available to eat including beans, broccoli, peas, carrots, corn, and others. Finally, the fifth and final food group is protein, which can be found in beef, chicken, eggs, nuts, fish, and pork.

The portion size of each food group is not the same. For example, it is recommended that a person eat slightly more vegetables and grains than fruit and protein for each meal.

Calories are a measure of the amount of energy in food items. A person's body needs to be replenished with calories to get the energy it needs to play, work, and move around. The calories get burned off during movement. But if a person eats more calories than they burn, the excess calories is stored as fat. There are also some foods that contain empty calories, meaning they have very little nutritional value such as solid fats and sugars.

There are many healthy foods that contains vitamins and minerals. For example, vitamin A is found in milk and helps keep the immune system healthy; Vitamin C is found in oranges and other vegetables, which is good for blood vessels, teeth, healing, and the brain. Vitamin D and calcium is great for healthy bones and can be found in milk. Iron is needed for the blood and is available in red meat, poultry, fish, and leafy vegetables. These are just a few of the minerals and vitamins that keep a person healthy.

- 1) Why is it most important for children to eat healthy food?
  - A. Children are smaller than adults.
  - B. They play and run more often.
