

# "ORGANIZE THE PROCESS"

NAME: \_\_\_\_\_

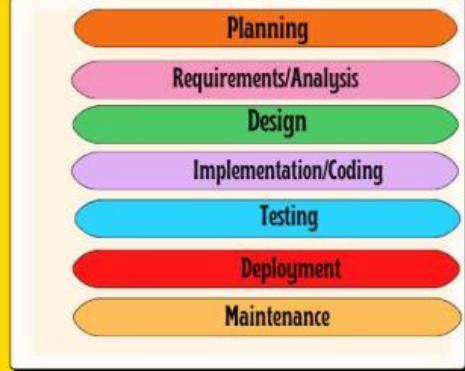

Fortalecimiento del aprendizaje del inglés en el área Técnica de Análisis y Desarrollo de Software (ADSO) para la aprehensión de vocabulario técnico aplicando la metodología English for Specific Purposes mediado por un RED

Write the function with the corresponding phase of Software Development Lifecycle ,

During this phase, architects and designers create a blueprint for the software's architecture, user interfaces, and data structures. This phase transforms the requirements into a comprehensive design that serves as a guide for the implementation process.

This phase involves rigorous testing of the software to identify defects and ensure its functionality. Test cases are executed to verify that the software meets the specified requirements and behaves as expected under various conditions.

This phase involves ongoing monitoring, bug fixing, and updates to the software. As users interact with the software, issues may arise that need to be addressed. Regular updates and improvements are made to enhance performance, security, and functionality over time.

In this phase, detailed specifications are gathered from stakeholders and end-users. These requirements are analyzed to ensure they are complete, feasible, and aligned with the project's objectives.

It begins where project goals, timelines, and resources are outlined. Stakeholders collaborate to define the project scope and establish a strategic roadmap for development.

After successful testing, this phase involves configuring servers, databases, and other components to ensure a smooth transition from development to production.

In this phase, developers write code based on the design specifications. This is where the actual software is built, using programming languages and following coding best practices.
