

GLOSSARY

Membrane - A

Mitochondria - B

Ribosomes - C

Nucleus - D

Cytoplasm - E

Lysosomes - F

These guys clean up the place getting rid of waste and other unwanted substances that may get into the cell.

This is the stuff that fills up the rest of the cell. It's mostly water.

It is the brains of the cell. It uses chromosomes to instruct the rest of the cell what to do next.

They are like tiny factories that make different things the cell needs to function, like proteins.

This is where the cell gets its energy. In the human body, food we have digested reacts with oxygen to make energy for the cell.

This is the outer boundary of the cell. Sort of like the skin. It allows some substances in and keeps others out.
