

# Food chain

A **food chain** maps the **eating patterns** of organisms in a habitat, showing the path of **food energy transfer**.

are organisms that make their food.  
Plants are examples of producers.

eat other living things.  
There are two types:

or herbivores are animals  
that eat producers

or carnivores are animals that  
eat primary consumers.

break down dead or organic matter.  
They are the last link in the chain.

mushrooms
