Learn More: Soil Is Alive!

Soil is important to the health of , fauna, landscapes, and people. Soil holds water, , the roots of trees and plants, and is for some animals. About 95% of all the food that people eat comes from the *

To help keep the soil healthy and reduce waste in , people can compost. To create your own compost, you will need a place outdoors or a special . You will need to collect brown and green . Brown materials are not living, like dead leaves and straw. Green materials are living, like colorful fruit and vegetable . In your compost pile, put a layer of green material and cover it with a layer of brown material. Repeat this each time you add to the compost pile. Keep the pile and mix it every week.
