Handphone

A mobile phone (also known as a wireless phone, cell phone, or cellular telephone) is a very small portable radio telephone. The first mobile phone networks were created in the late 1970s in Japan. A cell phone combines technologies, mainly telephone, radio, and computer. Cell phones work as two-way radios. They send electromagnetic microwaves from base station to base station. The waves are sent through antennas. This is called wireless communication.

There are different kinds of phones. A flip phone flips open, and is best for calling. A

bar phone is shaped like a candy bar, and the keys and screen are on one face. A slate phone is a phone that has almost no buttons, and uses a touchscreen. Most smartphones are slates. A slider phone slides on rails. It can slide out number keys or a mini keyboard, but some do both. A swivel spins on an axle.

Many 21st century mobile phones are smartphones. These phones can be used for email, browsing the internet, playing music and games, and many other functions that computers can perform. This is because mobile phones basically are small computers. Older phones also used computer technology, but lacked many of the parts of a computer that were too big to fit into a phone. Modern phone makers have been able to use smaller parts. Most smartphones are also GPS receivers and digital cameras.

TEXT 2

Laptop

A laptop is a computer which is easy to carry around. Its user can fold the laptop along its hinge for carrying. The laptop was created mainly for this particular reason. Computer parts were scaled to smaller size so this could happen.

The first laptop was invented in 1979 by British Designer Bill Moggridge. In 1982, two computer designers from Microsoft, Kazuhiko Nishi and Bill Gates, started their discussion concerning a new portable computer. The main thing about the computer was a new LCD technology. A year later the company launched its TRS-80 Model 100, which was a computer that looked pretty much like the laptops we know today.

The development of laptops continued with various upgrades and additional functions added.

Laptops have a lot of advantages like:

- People can carry them anywhere, whether office or home.
- They can be used in a smaller space than an ordinary personal computer.

At the same time portable computers have several negative points like:

- Price is higher
- Computer thefts became easier.
- While used in the car they can cause car accidents.
- They break more easily than desktop computers
