

# Volcanoes

## ➤ Fill in the text with the missing words.

There are volcanoes on every continent.

Some of them are \_\_\_\_\_ and they erupt regularly.

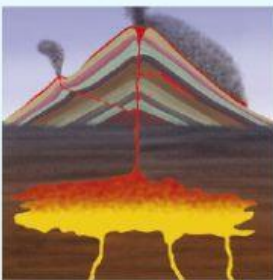

Some of them are \_\_\_\_\_. They haven't erupted for a long time but they could still erupt in the future.

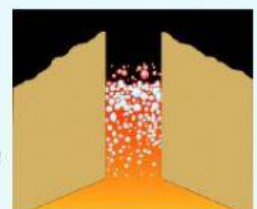

Others are \_\_\_\_\_. They haven't been active for thousands of years and will never erupt again.

## How do volcanoes erupt?

Earth is so hot under the surface that the rock is liquid. This liquid rock is called \_\_\_\_\_. Magma forms big caves inside Earth. They are called \_\_\_\_\_.

When pieces of rock fall into the magma, they make \_\_\_\_\_. When the pressure of the gas is very high, the gas and the magma come up through a hole. The hole is called \_\_\_\_\_.

We often see \_\_\_\_\_ before an eruption. When magma comes out of the crater, it's called \_\_\_\_\_. When lava gets cold, it becomes \_\_\_\_\_.
